

✅ TASK 1 — AI Prompting Lab Report

📄 What I Learned from the Lab

During the AI prompting lab, I learned how the quality of prompts directly affects the quality, accuracy, and structure of AI responses. Small changes in wording, clarity, and constraints significantly changed outputs.

I also understood that AI models are not “fixed responders” — they are highly sensitive to:

- Context provided in the prompt
 - Level of detail
 - Instruction style (role-based, step-by-step, etc.)
 - Iterative refinement
-

📊 How My Prompting Improved

At the start, my prompts were very basic like:

“Explain AI prompting”

Later, I improved them by adding structure:

- Role-based prompts (e.g., “Act as a teacher...”)
- Output format instructions (bullet points, tables, steps)
- Constraints (word limit, tone, audience level)
- Iterative refinement based on previous outputs

Example improvement:

Before:

“Explain snake game code”

After:

“Act as a senior game developer. Build a simple Snake game using HTML, CSS, and JavaScript. Provide clean code with comments and explain logic step by step.”

🧠 Most Effective Prompting Techniques

The most useful techniques were:

- **Role Prompting** (e.g., “Act as a developer/teacher/designer”)
 - **Step-by-step prompting**
 - **Iterative refinement**
 - **Constraint-based prompting**
 - **Example-driven prompting**
-

Challenges & Solutions

Challenge 1: AI gave incomplete or overly generic answers

Solution: Added more constraints and asked for structured output

Challenge 2: Code outputs sometimes had errors

Solution: Asked AI to debug step-by-step instead of regenerating everything

Challenge 3: Outputs were too long

Solution: Added word limits and format requirements
